Dataset

- 1. 数据源自行采集(NBA 高清视频 100 个)
- 三个层级标注: (能涵盖所有动作,避免重叠!)
 - a) action:

球无关: standing, waiting, moving, jumping

球有关: handling(控,包括运球/护球/接球), throwing(传), losing(失), spiking(击)

- b) interaction: block, steal,
- c) group activity (left/right): rebound(篮板球), shot(投球+miss 未中), foul(犯规), free throw(罚球), turnover(失误)

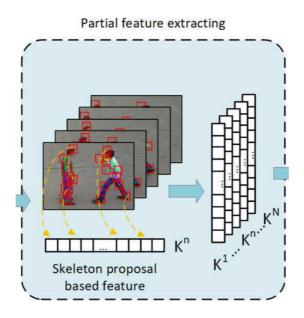

半场镜头,

划分: 首先筛选有效标注; 动作发生点前后各 1.5 秒钟

实验进展:

inference from posture to action

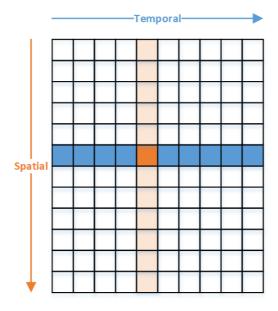

骨骼点提取的 demo 已经可以跑通,如何组织数据形式,还在思考。主要参考下图方法:

inference from action to action

Non-Local(无 temporal) Block 可达到预期效果,其中特征表示函数 g 通过全连接层实现,效果更佳。88.48%

Non-local(含 temporal) Block 过拟合严重! 加 Dropout 无效 计划解决方案:

Cross Interaction Block

Inference from action to activity
